

Discussion of

*The impact of air pollution on labour
productivity in France*

by Clara Koegel

Flavien Moreau

CompNet, Brussels

Oct 19-20 2023

Very neat JMP paper with clear contribution

- Super interesting topic
 - Highly relevant, active frontier: wildfires, airborne event (COVID)
 - Climate literature increasingly looking at “co-benefits”
- Great data (pollution data + firm-level data)
- Important policy findings/implications
 - 10% increase in fine PM → 1.5% decrease in labor productivity
 - European threshold is not stringent enough
 - Combatting air pollution “pays for itself”
- Comments:
 - Push the data a bit further
 - French admin data is rich, granular climate data increasingly available
 - Tighten some of the channels

Paper Overview: Main Mechanism

Emissions

PM 2.5

PM 10

**Air
Pollution**

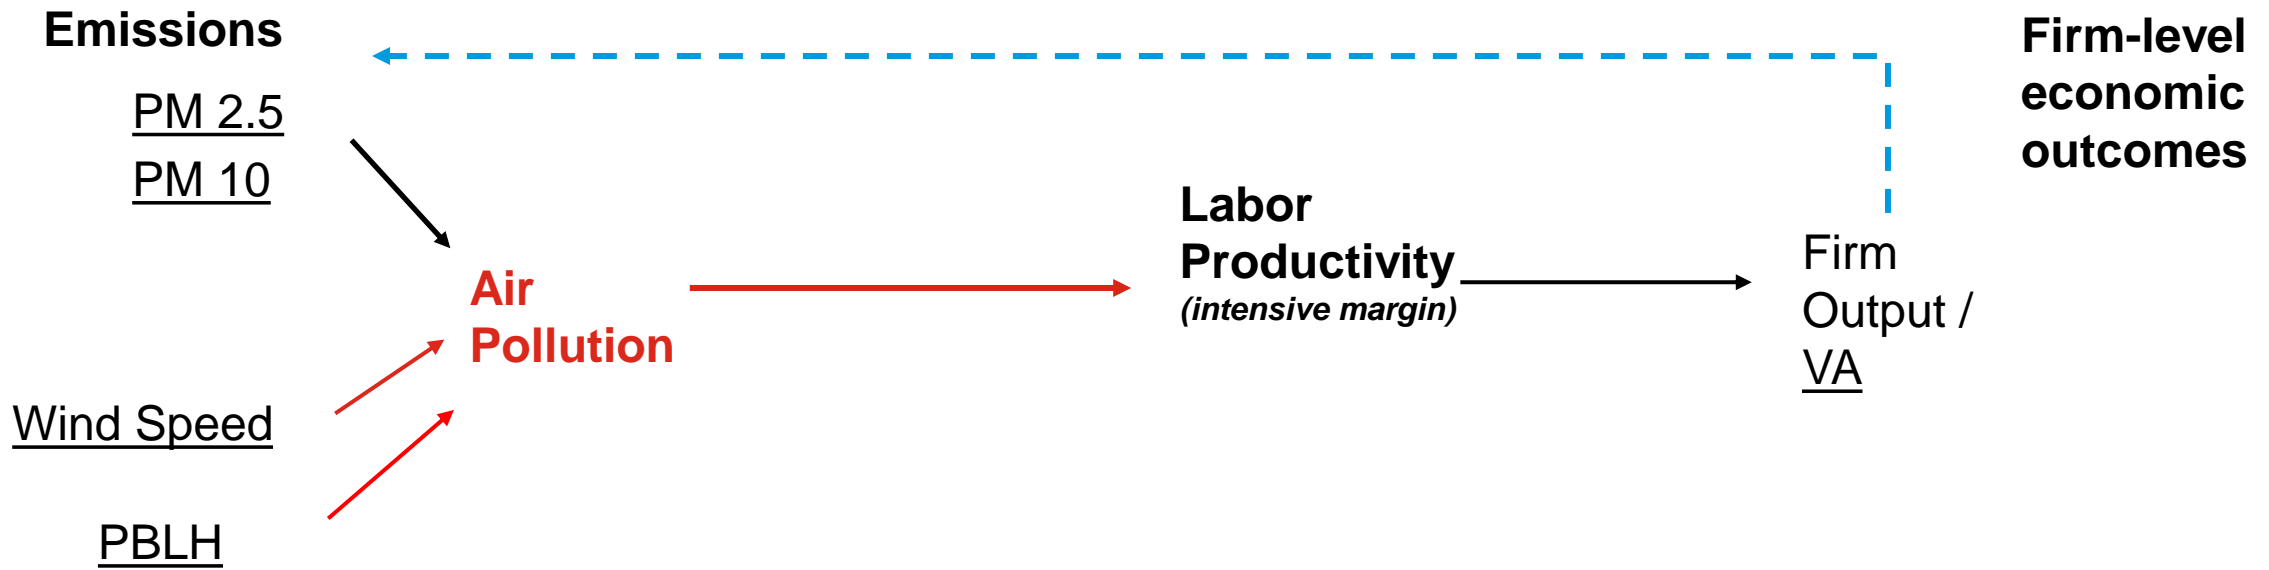

**Labor
Productivity**
(intensive margin)

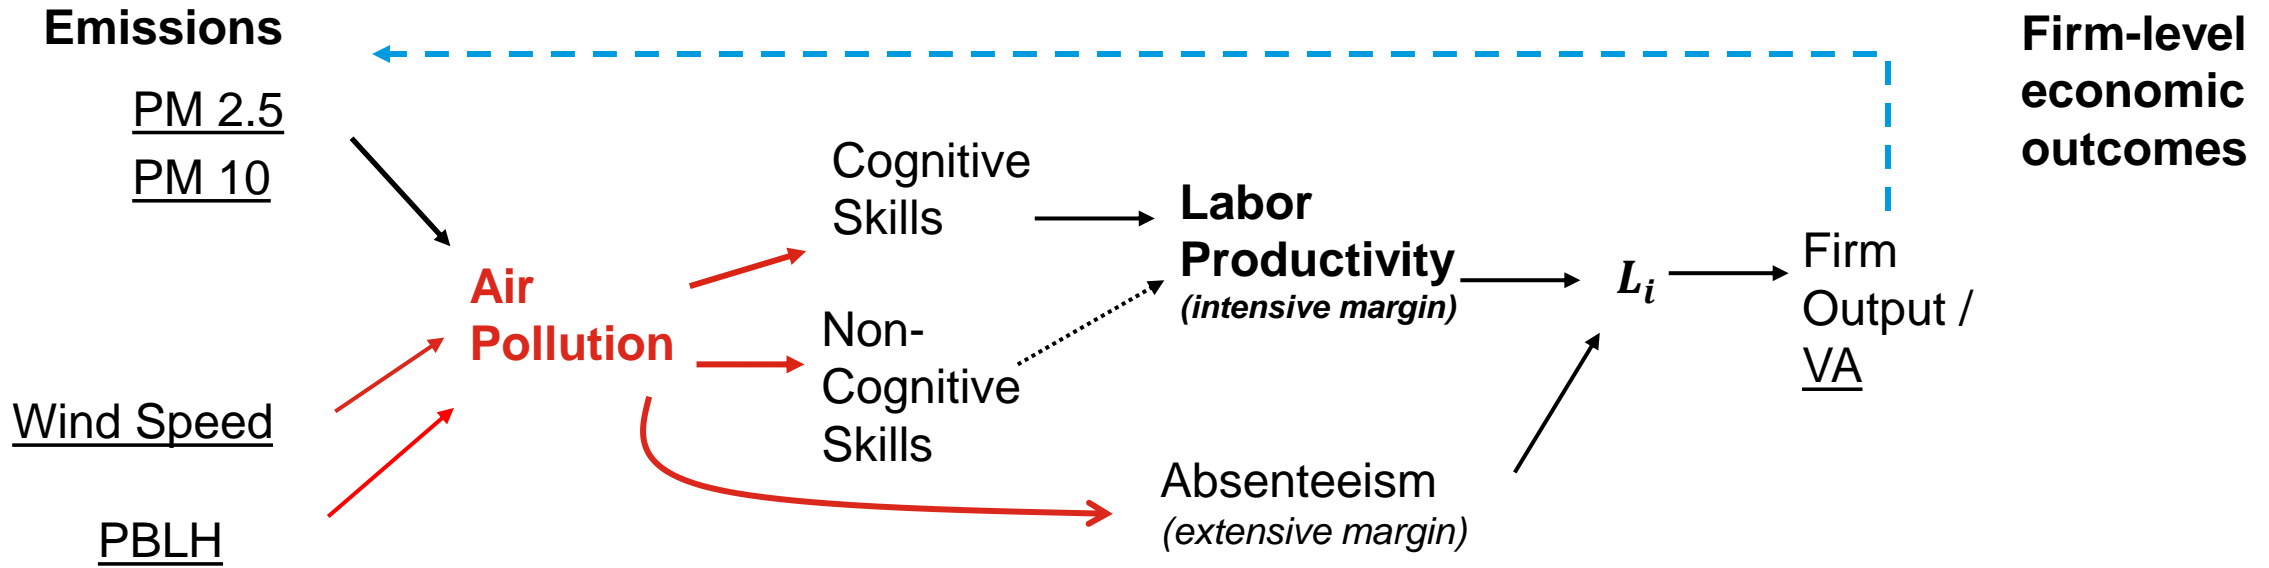

Firm
Output /
VA

**Firm-level
economic
outcomes**

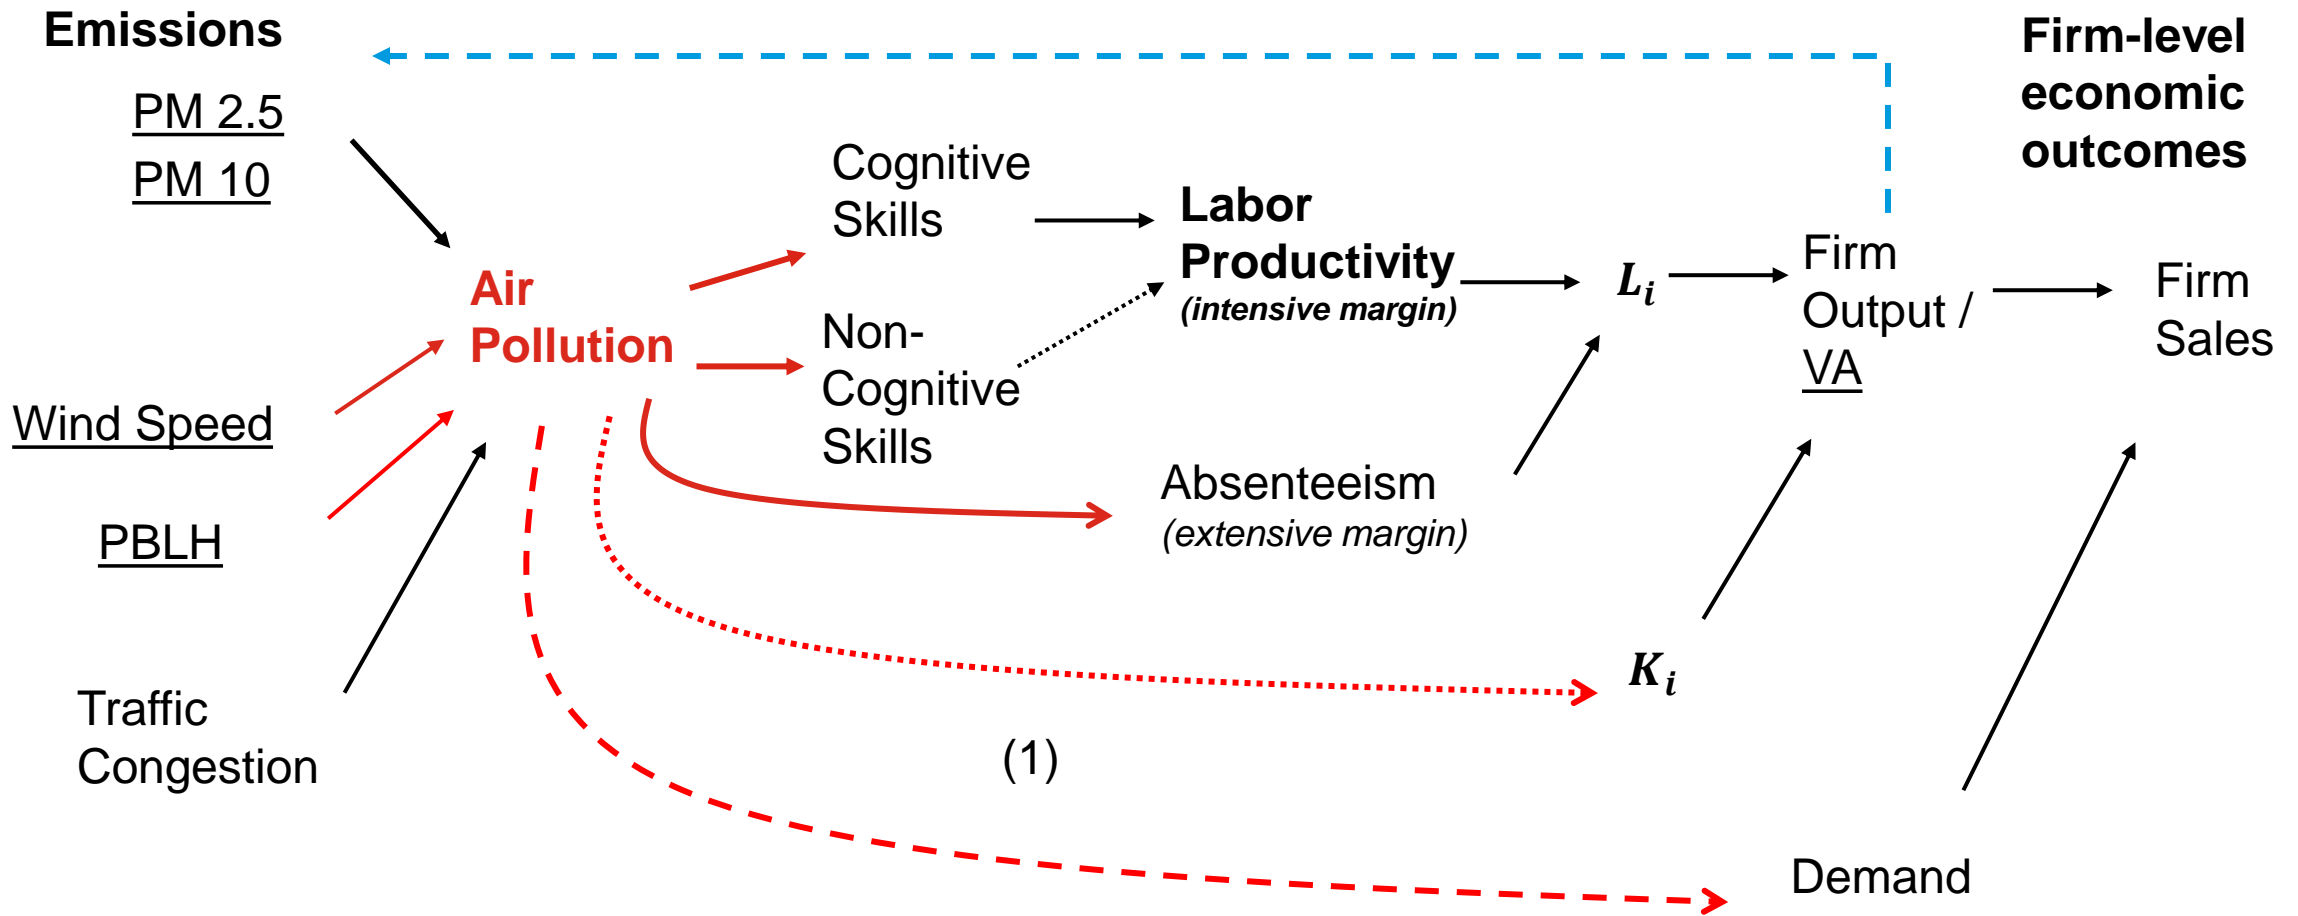

Paper Overview: Endogeneity

Paper Overview: Heterogeneity

Paper Overview: Other Channels?

(1) “no impact of air pollution on capital investment

(2)

(2): “As France has a relatively low average pollution level, few consumption decisions are sensitive to pollution events.”

Pushing the data a bit further

- Dropping multi-establishment firms can create a huge drop of power
 - Silver lining: may minimize the endogeneity issue (smaller firms)
 - Fix 1: include two-establishment firms: check company structure (with LiFi), what if 1 plant with 1 holding company?
 - Fix 2: apportionment: allocate sales based on headcount?
- Labor data
 - Why not use the DADS to get hours worked?
 - Data on job turnover (EMMO), or workplace injuries?
- Pollution data frequency
 - Some of the variables are daily/weekly, any way to get overall dataset more frequent than annual?
- Demand channel:
 - Heterogeneity in how firms are affected: e.g. retail foot-traffic / contact-facing activities
 - Leverage studies on COVID's impact on firm activity (Use measure/ranking of activities most impacted by covid?)

Additional comments

- Explain Planetary Boundary Layer Height better
 - *“PBLH is the area where most vertical exchange of heat, water vapour, and pollution between the earth’s surface and the atmosphere takes place”* p.14
 - How is it measured exactly (unit?)? How does it vary over time? Can it be affected by bad weather (storm)?
 - A nice figure could help visualize what is going on!
- Not obvious why cognitive skills more impacted.
 - E.g. precision manufacturing
- Can we understand the source and diffusion of PM better?
 - Specific polluting plants (French Rust belt), or cars (esp. diesel)
- Will Electric Vehicles save the day?
