

Embarassingly Parallel GMM over Split Data Sets

Eric Bartlesman and Richard Braeuer
discussed by Francesco Manaresi

CompNet Data User Conference
France Stratégiés, October 9, 2019

The Idea

- Develop a methodology to estimate (linear) GMM when datasets are split into subsamples that cannot be merged together.
- In a nutshell: compute each component of the numerator & the denominator of the estimator $Z'Y/Z'X$, then aggregate them “at home”
- Two cases, two examples:
 - **Case 1:** subsamples contain Z, X, and Y
Example 1: disentangling credit supply vs demand using various Credit Registries
 - **Case 2:** X and Y are in separated datasets (and Z can be matched to both)
Example 2: effect of education on firm productivity (X employee education, Y productivity, Z -say- compulsory educ.reform)

Overall Comments

- Very manageable
- Effective in allowing researchers and policy-makers to circumvent data restrictions
- Many potential applications (you name it...)

Looks like a Columbus' Egg!

Critical Points

- The pro's and con's of cross-country? The case of production function estimation.

$$y_{ic} = f(X_{ic}, \beta_c) + \omega_{ic} \quad (1)$$

OR

$$y_{ic} = f(X_{ic}, \beta) + \tilde{\omega}_{ic} \quad (2)$$

if true DGP is (2), then $\beta_c = \beta$,

if true DGP is (1), then $\tilde{\omega}_{ic}$ is biased (shall we make cross-country comparisons with biased TFP estimates?)

Critical Points

OR

$$y_{ic} = f(X_{ic}, \beta) + \tilde{\omega}_{ic} \quad (2)$$

if true DGP is (2), then $\beta_c = \beta$,

if true DGP is (1), then $\tilde{\omega}_{ic}$ is biased (shall we make cross-country comparisons with biased TFP estimates?)

- What about inference? Say, for policy evaluation.
Bootstrapping, wild bootstrapping, cluster-robust inference...
- In Case 2: ZY and ZX samples must have strictly the same observations,
otherwise you may need a “missing at random” assumption.

Conclusions

- A very interesting second-best solution. Useful for comparing across unintegrated countries (OECDs, Latin America, Asia, ...).

Conclusions

- A very interesting second-best solution. Useful for comparing across unintegrated countries (OECDs, Latin America, Asia, ...).
- from Columbus' Egg to Tesla's Egg
First-best for integrated economies (like EU!): allow for reliable, harmonized micro-level data at firm level.
H2020 MicroProd ?

Tesla's Egg of Columbus

How Tesla Performed the Feat of Columbus Without Cracking the Egg

PROBABLY one of the most far-reaching and revolutionary discoveries made by Mr. Tesla in the electrical engineering domain, this is a very accidental co-discovery of three magnetic, cyclotron-producing, systems with any speed desired. Long ago, when Tesla was still a student, he conceived the idea of the rotating magnetic field and this remarkably principle is embodied in his famous induction motor and system of transmission of power over an interlaced sea.

In this issue of the Electrical Experimenter Mr. Tesla gives a remarkable account of the early efforts and trials in an attempt to do the feat of Columbus. Unlike other technical publications, several of the other technical publications, at this time the world has and their methods and apparatus.

Fig. 2. Illustrating the Polyphase Coil and Rotating Magnetic Field Which Causes Currents to Flow in the Egg. Diagram of Coil Apparatus Showing Coil Connections to Different Phases.

phenomena which amazed the world when they were first shown to him. It results from the joint action of two or more alternating currents definitely related to one another and creating magnetic forces, which, in their periodic rise and fall...

hazard experimentation, the rotating field was purely the result of scientific investigation. Tesla developed and perfected, entirely by himself, this great idea in all its details and applications without making one single experiment! Not even the...
